

Work Log - February 23, 2023

Today, our team made significant progress towards achieving our project goals. Here are the tasks that we completed:

JIN created a workspace on Trello and successfully added all members to the platform.

JIN and JIANG obtained a private API from JCDecaux by creating an account on the platform.

Guo, JIN, and JIANG created a project workspace on Github and successfully invited all members to join.

As the team leader, Guo determined the work time, location, and content for the second workday, which will take place in the seminar room at James Joyce Library on February 24.

Our team had our first communication with our TA, which we will continue to have every two weeks.

JIN and JIANG downloaded and stored the static data from the JCDecaux website. For the second workday, we have the following tasks pending:

JIN is responsible for approving the join requests from JIANG and GUO in the Trello workspace.

Our team will create a database on AWS to store the dynamic data from JCDecaux.

We will use Python to obtain the dynamic data from JCDecaux and store it in the database mentioned above.

Our team will record the above work in Github, complete the work log, and send it on Trello.

We will also determine the time and content for the next workday.

Overall, we had a productive day and made good progress towards achieving our project objectives.
